

# iOS 原生项目嵌入 Flutter, pod install 报错问题

西瓜吃了吗

首先 让我们的iOS项目 关联 Flutter 模块, 实用 cocoapods 关联, 在 podfile 文件里添加如下代码:

```
flutter_application_path = '../flutter_module' //flutter模块的路径
load
File.join(flutter_application_path, '.iOS', 'Flutter', 'podhelper.rb') //函数调用加载flutter

platform :ios, '12.0'

target 'NativeDemo' do
  install_all_flutter_pods(flutter_application_path)
  use_frameworks!

  # Pods for NativeDemo
end
```

然后 pod install 第一次报错:

```
[!] Invalid `Podfile` file: Missing
`flutter_post_install(installer)` in Podfile `post_install`
block.

# from /Users/zhangfan/Desktop/flutter_folder/NativeDemo/
Podfile:7
# -----
# target 'NativeDemo' do
>   install_all_flutter_pods(flutter_application_path)
```

```
# use_frameworks!  
# -----
```

处理方法：

在 podfile 结尾添加

```
target 'app' do  
  // 用的各sdk  
end  
// 新增的配置  
post_install do |installer|  
  flutter_post_install(installer) if defined?  
    (flutter_post_install)  
end
```

继续 pod install 第二次报错：

```
[!] CocoaPods could not find compatible versions for pod  
"Flutter":  
  In Podfile:  
    Flutter (from `../flutter_module/.ios/Flutter`)  
  
Specs satisfying the `Flutter (from `../  
flutter_module/.ios/Flutter`)` dependency were found, but  
they required a higher minimum deployment target.
```

处理方法：

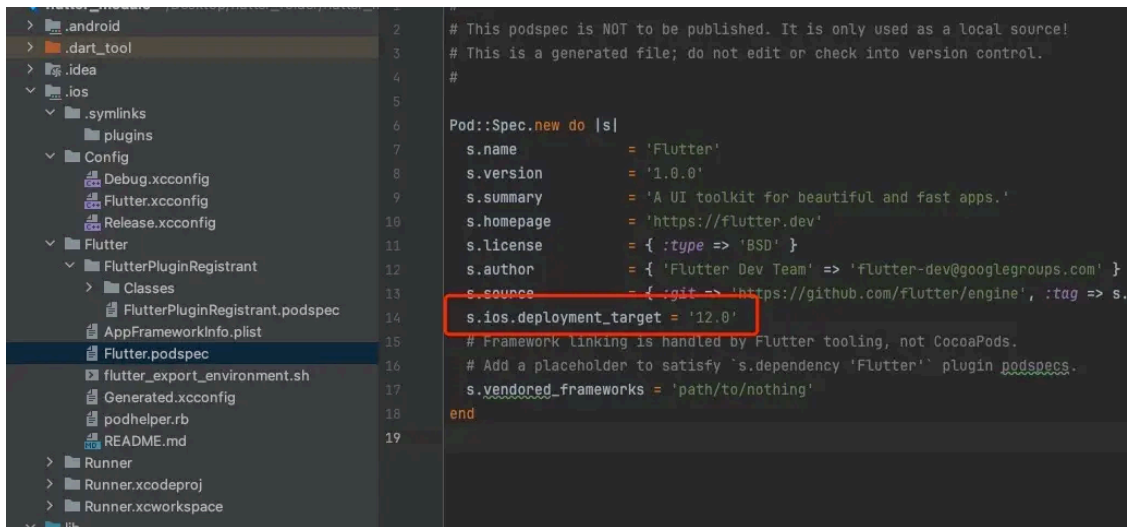

修改原生 Podfile 文件里的 Platform 的版本号 和 flutter 中  
iOS 下 Flutter.podspec 文件中的 ios.deployment\_target 版本  
号一致！

```
flutter_application_path = '../flutter_module'  
load  
File.join(flutter_application_path, '.ios', 'Flutter', 'podhel
```

```
per.rb')

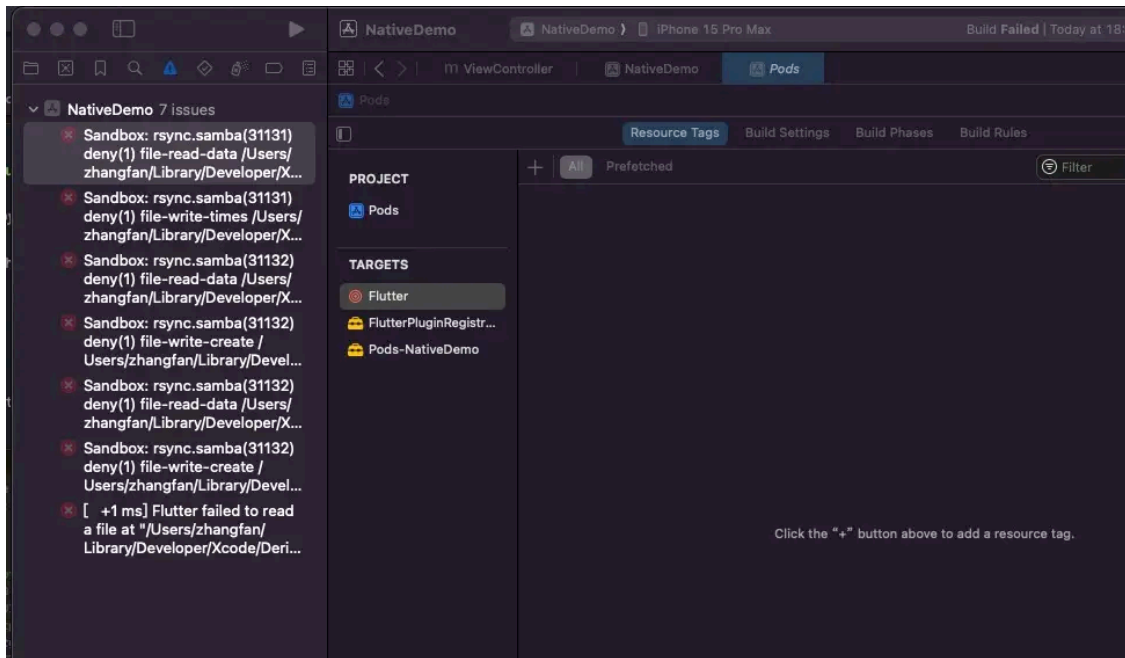

platform :ios, '12.0'//这里的版本号! 和下图
ios.deployment_target 版本号一致!
target 'NativeDemo' do
  install_all_flutter_pods(flutter_application_path)
  use_frameworks!
  # Pods for NativeDemo
end

post_install do |installer|
  flutter_post_install(installer) if defined?(
flutter_post_install)
end
```

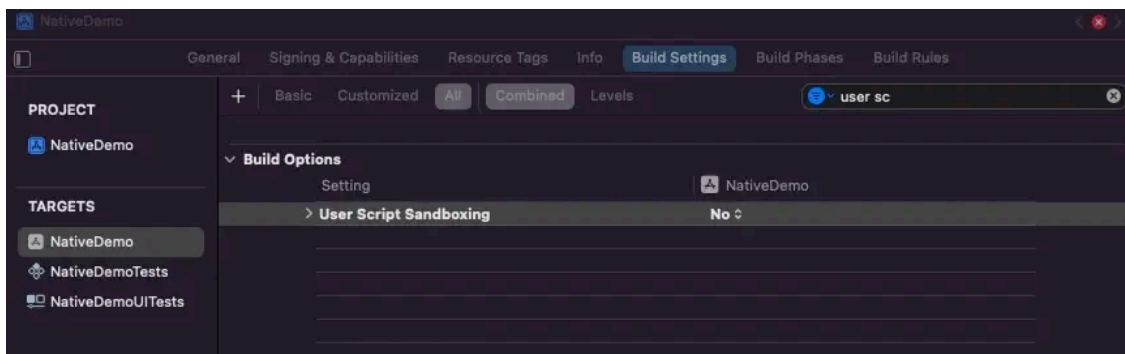

pod install 成功后，编译项目第三次报错：

```
Sandbox: rsync.samba(30002) deny(1) file-write-create /
Users/zhangfan/Library/Developer/Xcode/DerivedData/
NativeDemo-csscysefpzumudflovqmgvixwno/Build/Products/
Debug-iphonesimulator/Flutter.framework
```

处理方法：

1.Xcode targets 里面 buildsettings 搜索 User Script Sanboxing 改为 NO

2. 新版本的 Xcode 15 编译报该错误 右侧[工具栏]项目的 workspace 和 pod 的 space 都选择为 15.0 即可。
